1 todec: convert from degrees, minutes and seconds to decimal degrees

1.1 Use

```
proc todec(  
    in xmsc: real(?w)  
): real(w) {
```

Here `xmsc` is a real variable or value in the form `gggg.mmss` where the `gggg` are the degrees, `mm` are the minutes and `ss` the seconds. For example, `121.3740` means $121^{\circ} 37' 40''$. `todec` returns a real value in *decimal* degrees in the form `gggg.xxxx`. In the case above, `todec(121.3740)` returns `121.6278`.

2 rad2dec: convert radians to decimal degrees

2.1 Use

```
inline proc rad2dec(const in r: real(?w)): real(w) {
```

3 dec2rad: convert decimal degrees to radians

3.1 Use

```
inline proc rad2dec(const in r: real(?w)): real(w) {
```
